## 1.2 Bitree 2D

Given a 2d array allow you to sum *val* to the position  $(x, y)$  and find the sum of the rectangle with left top corner  $(x_1, y_1)$  and right bottom corner  $(x_2, y_2)$

**Update and query 1 indexed !**

Time: update  $O(\log n^2)$ , query  $O(\log n^2)$

```

struct Bit2d {
    int n;
    vll2d bit;
    Bit2d(int ni) : n(ni), bit(n + 1, vll(n + 1)) {}
    Bit2d(int ni, vll2d &xs) : n(ni), bit(n + 1, vll(n + 1)) {
        for (int i = 1; i <= n; i++) {
            for (int j = 1; j <= n; j++) {
                update(i, j, xs[i][j]);
            }
        }
    }

    void update(int x, int y, ll val) {
        for (; x <= n; x += (x & (-x))) {

```

```

        for (int i = y; i <= n; i += (i & (-i))) {
            bit[x][i] += val;
        }
    }
}

ll sum(int x, int y) {
    ll ans = 0;

    for (int i = x; i; i -= (i & (-i))) {
        for (int j = y; j; j -= (j & (-j))) {
            ans += bit[i][j];
        }
    }
    return ans;
}

ll query(int x1, int y1, int x2, int y2) {
    return sum(x2, y2) - sum(x2, y1 - 1) - sum(x1 - 1, y2) +
           sum(x1 - 1, y1 - 1);
}

};

```

### 1.3 Bitree

```

template <typename T>
struct BITree {
    int N;
    vector<T> v;

    BITree(int n) : N(n), v(n + 1, 0) {}

    void update(int i, const T& x) {
        if (i == 0) return;
        for (; i <= N; i += i & -i) v[i] += x;
    }

    T range_sum(int i, int j) {
        return range_sum(j) - range_sum(i - 1);
    }

    T range_sum(int i) {
        T sum = 0;
        for (; i > 0; i -= i & -i) sum += v[i];
        return sum;
    }
};

```

### 1.4 Convex Hull Trick / Line Container

Container where you can add lines of the form  $mx + b$ , and query maximum value at point  $x$ .  
`insert_line(m, b)` inserts the line  $m \cdot x + b$  in the container.  
`eval(x)` find the highest value among all lines in the point  $x$ .  
 both in  $O(\log N)$

```

const ll LLINF = 1e18;
const ll is_query = -LLINF;
struct Line {
    ll m, b;
    mutable function<const Line*> succ;
    bool operator<(const Line& rhs) const {
        if (rhs.b != is_query) return m < rhs.m;
        const Line* s = succ();
        if (!s) return 0;
        ll x = rhs.m;
        return b - s->b < (s->m - m) * x;
    }
};

struct Cht : public multiset<Line> { // maintain max m*x+b
    bool bad(iterator y) {
        auto z = next(y);
        if (y == begin()) {
            if (z == end()) return 0;
            return y->m == z->m && y->b <= z->b;
        }
        auto x = prev(y);
        if (z == end()) return y->m == x->m && y->b <= x->b;
        return (ld)(x->b - y->b) * (z->m - y->m) >=
               (ld)(y->b - z->b) * (y->m - x->m);
    }

    void insert_line(
        ll m, ll b) { // min -> insert (-m, -b) -> -eval()
        auto y = insert({m, b});
        y->succ = [=] {
            return next(y) == end() ? 0 : &*next(y);
        };
        if (bad(y)) {
            erase(y);
            return;
        }
        while (next(y) != end() && bad(next(y))) erase(next(y));
        while (y != begin() && bad(prev(y))) erase(prev(y));
    }

    ll eval(ll x) {
        auto l = *lower_bound((Line){x, is_query});

```

```

    return l.m * x + l.b;
}
};

```

## 1.5 Disjoint Sparse Table

Answers queries of any monoid operation (i.e. has identity element and is associative)  
 Build:  $O(N \log N)$ , Query:  $O(1)$

```

#define F(expr) [](auto a, auto b) { return expr; }
template <typename T>
struct DisjointSparseTable {
    using Operation = T (*)(T, T);

    vector<vector<T>> st;

        return ps[x] == x ? x : ps[x] = find_set(ps[x]);
    }

    int size(int u) { return sz[find_set(u)]; }
    bool same_set(int x, int y) {
        return find_set(x) == find_set(y);
    }

    void union_set(int x, int y) {
        if (same_set(x, y)) return;

        int px = find_set(x);
        int py = find_set(y);

        if (sz[px] < sz[py]) swap(px, py);

```

```

    ps[py] = px;
    sz[px] += sz[py];
    // sts[px].merge(sts[py]);
}
};

```

## 1.7 Lichao Tree (dynamic)

Lichao Tree that creates the nodes dynamically, allowing to query and update from range  $[MAXL, MAXR]$

*query(x)* : find the highest point among all lines in the structure

*add(a, b)* : add a line of form  $y = ax + b$  in the structure

*addSegment(a, b, l, r)* : add a line segment of form  $y = ax + b$  which covers from range  $[l, r]$

time:  $O(\log N)$

```

template <typename T = ll, T MAXL = 0,
          T MAXR = 1'000'000'001>
struct LiChaoTree {
    static const T inf = -numeric_limits<T>::max() / 2;
    bool first_best(T a, T b) { return a > b; }
    T get_best(T a, T b) { return first_best(a, b) ? a : b; }
    struct line {
        T m, b;
        T operator()(T x) { return m * x + b; }
    };
    struct node {
        line li;
        node *left, *right;
        node(line _li = {0, inf})
            : li(_li), left(nullptr), right(nullptr) {}
        ~node() {
            delete left;
            delete right;
        }
    };
    node *root;
    LiChaoTree(line li = {0, inf}) : root(new node(li)) {}
    ~LiChaoTree() { delete root; }
    T query(T x, node *cur, T l, T r) {
        if (cur == nullptr) return inf;
        if (x < l or x > r) return inf;
        T mid = midpoint(l, r);
        T ans = cur->li(x);
        ans = get_best(ans, query(x, cur->left, l, mid));
        ans = get_best(ans, query(x, cur->right, mid + 1, r));
        return ans;
    }
};

```

```

T query(T x) { return query(x, root, MAXL, MAXR); }
void add(line li, node *&cur, T l, T r) {
    if (cur == nullptr) {
        cur = new node(li);
        return;
    }
    T mid = midpoint(l, r);
    if (first_best(li(mid), cur->li(mid)))
        swap(li, cur->li);
    if (first_best(li(l), cur->li(l)))
        add(li, cur->left, l, mid);
    if (first_best(li(r), cur->li(r)))
        add(li, cur->right, mid + 1, r);
}
void add(T m, T b) { add({m, b}, root, MAXL, MAXR); }
void addSegment(line li, node *&cur, T l, T r, T lseg,
                T rseg) {
    if (r < lseg || l > rseg) return;
    if (cur == nullptr) cur = new node;
    if (lseg <= l && r <= rseg) {
        add(li, cur, l, r);
        return;
    }
    T mid = midpoint(l, r);
    if (l != r) {
        addSegment(li, cur->left, l, mid, lseg, rseg);
        addSegment(li, cur->right, mid + 1, r, lseg, rseg);
    }
}
void addSegment(T a, T b, T l, T r) {
    addSegment({a, b}, root, MAXL, MAXR, l, r);
}
};

```

## 1.8 Merge Sort Tree

Like a segment tree but each node  $st_i$  stores a sorted subarray

- *inrange(l, r, a, b)* : counts the number of elements  $x \in [l, r]$  such that  $a \leq x \leq b$ .

Memory:  $O(n \log N)$  Time: build  $O(N \log N)$ , *inrange*  $O(\log N)$

```

template <class T>
struct MergeSortTree {
    int n;
    vector<vector<T>> st;
    MergeSortTree(vector<T> &xs) : n(len(xs)), st(n << 1) {

```

```

for (int i = 0; i < n; i++)
    st[i + n] = vector<T>({xs[i]});

for (int i = n - 1; i > 0; i--) {
    st[i].resize(len(st[i << 1]) + len(st[i << 1 | 1]));
    merge(all(st[i << 1]), all(st[i << 1 | 1]),
          st[i].begin());
}
}

int count(int i, T a, T b) {
    return upper_bound(all(st[i]), b) -
           lower_bound(all(st[i]), a);
}

int inrange(int l, int r, T a, T b) {
    int ans = 0;

    for (l += n, r += n + 1; l < r; l >>= 1, r >>= 1) {
        if (l & 1) ans += count(l++, a, b);
        if (r & 1) ans += count(--r, a, b);
    }

    return ans;
}
};

```

## 1.9 Ordered Set

If you need an ordered **multiset** you may add an id to each value. Using `greater_equal`, or `less_equal` is considered undefined behavior.

- **order\_of\_key(k)** : Number of items strictly smaller/greater than k .
- **find\_by\_order(k)** : K-th element in a set (counting from zero).

```

#include <ext/pb_ds/assoc_container.hpp>
#include <ext/pb_ds/tree_policy.hpp>
using namespace __gnu_pbds;

template <typename T>
using ordered_set = tree<T, null_type, less<T>, rb_tree_tag,
                        tree_order_statistics_node_update>;

```

## 1.10 Prefix Sum 2D

Given an 2d array with  $n$  lines and  $m$  columns, find the sum of the subarray that have the left upper corner at  $(x1, y1)$  and right bottom corner at  $(x2, y2)$ .

Time: build  $O(n \cdot m)$ , query  $O(1)$ .

```

struct psum2d {
    vll2d s;
    vll2d psum;
    psum2d(vll2d &grid, int n, int m)
        : s(n + 1, vll(m + 1)), psum(n + 1, vll(m + 1)) {
        for (int i = 1; i <= n; i++)
            for (int j = 1; j <= m; j++)
                s[i][j] = s[i][j - 1] + grid[i][j];

        for (int i = 1; i <= n; i++)
            for (int j = 1; j <= m; j++)
                psum[i][j] = psum[i - 1][j] + s[i][j];
    }

    ll query(int x1, int y1, int x2, int y2) {
        ll ans = psum[x2][y2] + psum[x1 - 1][y1 - 1];
        ans -= psum[x2][y1 - 1] + psum[x1 - 1][y2];
        return ans;
    }
};

```

## 1.11 SegTree Range Sum Query Range PA sum/set Update

Makes arithmetic progression updates in range and sum queries.

Considering  $PA(A, R) = [A + R, A + 2R, A + 3R, \dots]$

- **update\_set(l, r, A, R)**: sets  $[l, r]$  to  $PA(A, R)$
- **update\_add(l, r, A, R)**: sum  $PA(A, R)$  in  $[l, r]$
- **query(l, r)**: sum in range  $[l, r]$

**0 indexed !**

Time: build  $O(n)$ , updates and queries  $O(\log n)$

```

const ll oo = 1e18;

                         t[n / b * j + y - (1 << j) + 1]));
    }
    return ans;
}
};

```

## 2 Dynamic programming

### 2.1 Binary Knapsack (bottom up)

Given the points each element have, and it respective cost, computes the maximum points we can get if we can ignore/choose an element, in such way that the sum of costs don't exceed the maximum cost allowed  
Time and space:  $O(N * W)$

the vectors *VS* and *WS* starts at one, so it need an empty value at index 0.

```

const int MAXN(1'000), MAXCOST(1'000 * 20);
ll dp[MAXN + 1][MAXCOST + 1];
bool ps[MAXN + 1][MAXCOST + 1];
pair<ll, vi> knapsack(const vll &points, const vi &costs,
                     int maxCost) {
    int n = len(points) - 1; // ELEMENTS START AT INDEX 1 !

    for (int m = 0; m <= maxCost; m++) {
        dp[0][m] = 0;
    }

    for (int i = 1; i <= n; i++) {
        dp[i][0] = dp[i - 1][0] + (costs[i] == 0) * points[i];
        ps[i][0] = costs[i] == 0;
    }

    for (int i = 1; i <= n; i++) {
        for (int m = 1; m <= maxCost; m++) {
            dp[i][m] = dp[i - 1][m], ps[i][m] = 0;
            int w = costs[i];
            ll v = points[i];

            if (w <= m and dp[i - 1][m - w] + v > dp[i][m]) {

```

```

        dp[i][m] = dp[i - 1][m - w] + v, ps[i][m] = 1;
    }
}

vi is;
for (int i = n, m = maxCost; i >= 1; --i) {
    if (ps[i][m]) {
        is.emplace_back(i);
        m -= costs[i];
    }
}

return {dp[n][maxCost], is};
}

```

## 2.2 Binary Knapsack (top down)

Given  $N$  items, each with its own value  $V_i$  and weight  $W_i$  and a maximum knapsack weight  $W$ , compute the maximum value of the items that we can carry, if we can either ignore or take a particular item.

Assume that  $1 \leq n \leq 1000, 1 \leq S \leq 10000$ .

Time and space:  $O(N * W)$

the bottom up version is 5 times faster !

```

const int MAXN(2000), MAXM(2000);
ll memo[MAXN][MAXM + 1];
char choosen[MAXN][MAXM + 1];
ll knapSack(int u, int w, vll &VS, vi &WS) {
    if (u < 0) return 0;
    if (memo[u][w] != -1) return memo[u][w];

    ll a = 0, b = 0;
    a = knapSack(u - 1, w, VS, WS);
    if (WS[u] <= w)
        b = knapSack(u - 1, w - WS[u], VS, WS) + VS[u];
    if (b > a) {
        choosen[u][w] = true;
    }
    return memo[u][w] = max(a, b);
}

pair<ll, vi> knapSack(int W, vll &VS, vi &WS) {
    memset(memo, -1, sizeof(memo));
    memset(choosen, 0, sizeof(choosen));
    int n = len(VS);
    ll v = knapSack(n - 1, W, VS, WS);
    ll cw = W;
    vi choosed;

```

```

    for (int i = n - 1; i >= 0; i--) {
        if (choosen[i][cw]) {
            cw -= WS[i];
            choosed.emplace_back(i);
        }
    }
    return {v, choosed};
}

```

## 2.3 Edit Distance

$O(N * M)$

```

int edit_distance(const string &a, const string &b) {
    int n = a.size();
    int m = b.size();
    vector<vi> dp(n + 1, vi(m + 1, 0));

    int ADD = 1, DEL = 1, CHG = 1;
    for (int i = 0; i <= n; ++i) {
        dp[i][0] = i * DEL;
    }
    for (int i = 1; i <= m; ++i) {
        dp[0][i] = ADD * i;
    }

    for (int i = 1; i <= n; ++i) {
        for (int j = 1; j <= m; ++j) {
            int add = dp[i][j - 1] + ADD;
            int del = dp[i - 1][j] + DEL;
            int chg = dp[i - 1][j - 1] +
                (a[i - 1] == b[j - 1] ? 0 : 1) * CHG;
            dp[i][j] = min({add, del, chg});
        }
    }

    return dp[n][m];
}

```

## 2.4 Kadane

Find the maximum subarray sum in a given array.

```

int kadane(const vi &as) {
    vi s(len(as));
    s[0] = as[0];

```

```

for (int i = 1; i < len(as); ++i)
    s[i] = max(as[i], s[i - 1] + as[i]);

return *max_element(all(s));
}

```

## 2.5 Knapsack with quantity (no recover)

finds the maximum score you can achieve, given that you have  $n$  items, each item has a *cost*, a *point* and a *quantity*, you can spent at most *maxcost* and buy each item the maximum quantity it has.  
time:  $O(n \cdot \text{maxcost} \cdot \log \text{maxqtd})$  memory:  $O(\text{maxcost})$ .

```

11 knapsack(const vi &weight, const vll &value,
           const vi &qtd, int maxCost) {
    vi costs;
    vll values;
    for (int i = 0; i < len(weight); i++) {
        ll q = qtd[i];
        for (ll x = 1; x <= q; q -= x, x <= 1) {
            costs.eb(x * weight[i]);
            values.eb(x * value[i]);
        }
        if (q) {
            costs.eb(q * weight[i]);
            values.eb(q * value[i]);
        }
    }

    vll dp(maxCost + 1);
    for (int i = 0; i < len(values); i++) {
        for (int j = maxCost; j > 0; j--) {
            if (j >= costs[i])
                dp[j] = max(dp[j], values[i] + dp[j - costs[i]]);
        }
    }
    return dp[maxCost];
}

```

## 2.6 Longest Increasing Subsequence (LIS)

Find the pair  $(sz, psx)$  where  $sz$  is the size of the longest subsequence and  $psx$  is a vector where  $psx_i$  tells the size of the longest increase subsequence that ends at position  $i$ .  $get_idx$  just tells which indices could be in the longest increasing subsequence.

Time:  $O(n \log n)$

```

template <typename T>

```

```

pair<int, vector<int>> lis(const vector<T> &xs) {
    int n = xs.size();

    vector<T> dp(n + 1, numeric_limits<T>::max());
    dp[0] = numeric_limits<T>::min();

    int sz = 0;
    vector<int> psx(n);

    for (int i = 0; i < n; i++) {
        auto it = lower_bound(dp.begin(), dp.end(), xs[i]);
        auto pos = (int)(it - dp.begin());

        sz = max(sz, pos);

        dp[pos] = xs[i];

        psx[i] = pos;
    }

    return {sz, psx};
}

template <typename T>
vector<int> get_idx(vector<T> xs) {
    auto [sz1, psx1] = lis(xs);

    reverse(xs.begin(), xs.end());
    for (auto &xi : xs) xi = -xi;

    auto [sz2, psx2] = lis(xs);

    vector<int> ans;
    int _n = xs.size();
    for (int i = 0; i < _n; i++) {
        int l = psx1[i];
        int r = psx2[_n - i - 1];
        if (l + r - 1 == sz1) ans.push_back(i);
    }

    return ans;
}

```

## 2.7 Money Sum (Bottom Up)

Find every possible sum using the given values only once.

```
set<int> money_sum(const vi &xs) {
    using vc = vector<char>;
    using vvc = vector<vc>;
    int _m = accumulate(all(xs), 0);
    int _n = xs.size();
    vvc _dp(_n + 1, vc(_m + 1, 0));
    set<int> _ans;
    _dp[0][xs[0]] = 1;
    for (int i = 1; i < _n; ++i) {
        for (int j = 0; j <= _m; ++j) {
            if (j == 0 or _dp[i - 1][j]) {
                _dp[i][j + xs[i]] = 1;
                _dp[i][j] = 1;
            }
        }
    }

    for (int i = 0; i < _n; ++i)
        for (int j = 0; j <= _m; ++j)
            if (_dp[i][j]) _ans.insert(j);
    return _ans;
}
```

## 2.8 Travelling Salesman Problem

```
using vi = vector<int>;
vector<vi> dist;
vector<vi> memo;
/* O ( N^2 * 2^N )*/
int tsp(int i, int mask, int N) {
    if (mask == (1 << N) - 1) return dist[i][0];
    if (memo[i][mask] != -1) return memo[i][mask];
    int ans = INT_MAX << 1;
    for (int j = 0; j < N; ++j) {
        if (mask & (1 << j)) continue;
        auto t = tsp(j, mask | (1 << j), N) + dist[i][j];
        ans = min(ans, t);
    }
    return memo[i][mask] = ans;
}
```

## 3 Extras

### 3.1 Binary To Gray

```
string binToGray(string bin) {
    string gray(bin.size(), '0');
    int n = bin.size() - 1;
    gray[0] = bin[0];
    for (int i = 1; i <= n; i++) {
        gray[i] = '0' + (bin[i - 1] == '1') ^ (bin[i] == '1');
    }
    return gray;
}
```

### 3.2 Closest value greater than

This structure allows you to answer the closest value to the position  $i$  that is greater than  $xs_i$ , the answer is given as a pair  $(l, r)$  is the position of the closest greater value to the the left and right respectively, both can be  $-1$  if there is no such value. Build it with the size of the vector or the vector itself.

Time:  $O(\log N^2)$

```
template <typename T>
struct CVGT {
    struct SegTree {
        int n;
        vector<T> st;
        SegTree(int _n)
            : n(_n), st(n << 1, numeric_limits<T>::min()) {}

        void assign(int p, const T &k) {
            for (st[p += n] = k; p >= 1;)
                st[p] = max(st[p << 1], st[p << 1 | 1]);
        }

        T query(int l, int r) {
            T ans1, ansr;
            ans1 = ansr = numeric_limits<T>::min();
            for (l += n, r += n + 1; l < r; l >= 1, r >= 1) {
                if (l & 1) ans1 = max(ans1, st[l++]);
                if (r & 1) ansr = max(st[--r], ansr);
            }

            return max(ans1, ansr);
        }
    };

    int n;
    SegTree st;
};
```

```

CVGT(int _n) : n(_n), st(n) {}
CVGT(const vector<T> &xs) : n(xs.size()), st(n) {
    for (int i = 0; i < n; i++) {
        st.assign(i, xs[i]);
    }
}

void assign(int p, const T &x) { st.assign(p, x); }

pair<int, int> query(int i) {
    int L = -1;

    auto vi = st.query(i, i);
    for (int l = 0, r = i - 1; l <= r;) {
        int m = midpoint(l, r);
        ll vm = st.query(m, i - 1);
        if (vm >= vi) {
            L = max(L, m);
            l = m + 1;
        } else
            r = m - 1;
    }

    int R = n * 2;
    for (int l = i + 1, r = n - 1; l <= r;) {
        int m = midpoint(l, r);

        ll vm = st.query(i + 1, m);
        if (vm >= vi) {
            r = m - 1;
            R = min(R, m);
        } else
            l = m + 1;
    }

    return {L, R == n * 2 ? -1 : R};
}
};

```

### 3.3 Get Permutation Cycles

```

/*
 * receives a permutation [0, n-1]
 * returns a vector of cycles

```

```

 * for example: [ 1, 0, 3, 4, 2] -> [[0, 1], [2, 3, 4]]
 * */
vector<vll> getPermutationCicles(const vll &ps) {
    ll n = len(ps);
    vector<char> visited(n);
    vector<vll> cicles;
    for (int i = 0; i < n; ++i) {
        if (visited[i]) continue;

        vll cicle;
        ll pos = i;
        while (!visited[pos]) {
            cicle.pb(pos);
            visited[pos] = true;
            pos = ps[pos];
        }

        cicles.push_back(vll(all(cicle)));
    }
    return cicles;
}

```

### 3.4 Hanoi Tower

Let  $T_n$  be the total of moves to solve a hanoi tower, we know that  $T_n \geq 2 \cdot T_{n-1} + 1$ , for  $n > 0$ , and  $T_0 = 0$ . By induction it's easy to see that  $T_n = 2^n - 1$ , for  $n > 0$ .

The following algorithm finds the necessary steps to solve the game for 3 stacks and  $n$  disks.

```

void move(int a, int b) { cout << a << ' ' << b << endl; }
void solve(int n, int s, int e) {
    if (n == 0) return;
    if (n == 1) {
        move(s, e);
        return;
    }
    solve(n - 1, s, 6 - s - e);
    move(s, e);
    solve(n - 1, 6 - s - e, e);
}

```

### 3.5 Mo's Algorithm

```

template <typename T>
struct Mo {
    struct Query {
        int l, r, idx, block;

```

```

Query(int _l, int _r, int _idx, int _block)
: l(_l), r(_r), idx(_idx), block(_block) {}

bool operator<(const Query &q) const {
    if (block != q.block) return block < q.block;
    return (block & 1 ? (r < q.r) : (r > q.r));
}

};

vector<T> vs;
vector<Query> qs;
const int block_size;

Mo(const vector<T> &a)
: vs(a), block_size((int)ceil(sqrt(a.size()))) {}

void add_query(int l, int r) {
    qs.emplace_back(l, r, qs.size(), l / block_size);
}

auto solve() {
    // get answer return type
    vector<ll> answers(qs.size());
    sort(all(qs));

    int cur_l = 0, cur_r = -1;
    for (auto q : qs) {
        while (cur_l > q.l) add(--cur_l);
        while (cur_r < q.r) add(++cur_r);
        while (cur_l < q.l) remove(cur_l++);
        while (cur_r > q.r) remove(cur_r--);
        answers[q.idx] = get_answer();
    }

    return answers;
}

private:
// add value at idx from data structure
inline void add(int idx) {}

// remove value at idx from data structure
inline void remove(int idx) {}

// extract current answer of the data structure

```

```

inline auto get_answer() {}
};

```

## 4 Geometry

### 4.1 Check Point Inside Triangle

Guess what ? it checks if the point  $e$  is inside the triangle formed by the points  $t1, t2, t3$ .

```

struct point {
    int x, y;
    int id;

    point operator-(const point &o) const {
        return {x - o.x, y - o.y};
    }

    int operator^(const point &o) const {
        return x * o.y - y * o.x;
    }
};

/*
    Verify the direction that the point
    _e_ is in relation to the vector
    formed by the points a->b
    -1 = right
    0 = collinear
    1 = left
*/
int ccw(point a, point b, point e) {
    int tmp = (b - a) ^ (e - a);
    return (tmp > 0) - (tmp < 0);
}

/*
    Verify if the point e
    is inside the triangle formed by
    the points t1, t2, t3
*/
bool inside_triangle(point t1, point t2, point t3,
                    point e) {
    int x = ccw(t1, t2, e);
    int y = ccw(t2, t3, e);
    int z = ccw(t3, t1, e);
    return !((x == 1 or y == 1 or z == 1) and
            (x == -1 or y == -1 or z == -1));
}

```

## 4.2 Convex Hull

Given a set of points find the smallest convex polygon that contains all the given points.

Time:  $O(N \log N)$

By default it removes the collinear points, set the boolean to true if you don't want that

```
struct pt {
    double x, y;
    int id;
};

int orientation(pt a, pt b, pt c) {
    double v = a.x * (b.y - c.y) + b.x * (c.y - a.y) +
              c.x * (a.y - b.y);
    if (v < 0) return -1; // clockwise
    if (v > 0) return +1; // counter-clockwise
    return 0;
}

bool cw(pt a, pt b, pt c, bool include_collinear) {
    int o = orientation(a, b, c);
    return o < 0 || (include_collinear && o == 0);
}

bool collinear(pt a, pt b, pt c) {
    return orientation(a, b, c) == 0;
}

void convex_hull(vector<pt>& pts,
                bool include_collinear = false) {
    pt p0 = *min_element(all(pts), [](pt a, pt b) {
        return make_pair(a.y, a.x) < make_pair(b.y, b.x);
    });
    sort(all(pts), [&p0](const pt& a, const pt& b) {
        int o = orientation(p0, a, b);
        if (o == 0)
            return (p0.x - a.x) * (p0.x - a.x) +
                   (p0.y - a.y) * (p0.y - a.y) <
                   (p0.x - b.x) * (p0.x - b.x) +
                   (p0.y - b.y) * (p0.y - b.y);
        return o < 0;
    });
    if (include_collinear) {
        int i = len(pts) - 1;
        while (i >= 0 && collinear(p0, pts[i], pts.back())) i--;
        reverse(pts.begin() + i + 1, pts.end());
    }
}
```

```
vector<pt> st;
for (int i = 0; i < len(pts); i++) {
    while (st.size() > 1 && !cw(st[len(st) - 2], st.back(),
                               pts[i], include_collinear))
        st.pop_back();
    st.push_back(pts[i]);
}

pts = st;
}
```

## 4.3 Determinant

```
#include "Point.cpp"

template <typename T>
T D(const Point<T> &P, const Point<T> &Q,
    const Point<T> &R) {
    return (P.x * Q.y + P.y * R.x + Q.x * R.y) -
           (R.x * Q.y + R.y * P.x + Q.x * P.y);
}
```

## 4.4 Equals

```
template <typename T>
bool equals(T a, T b) {
    const double EPS{1e-9};
    if (is_floating_point<T>::value)
        return fabs(a - b) < EPS;
    else
        return a == b;
}
```

## 4.5 Line

```
#include <bits/stdc++.h>

#include "point-struct-and-utils.cpp"
using namespace std;

struct line {
    ld a, b, c;
};
```

// the answer is stored in the third parameter (pass by

```
// reference)
void pointsToLine(const point &p1, const point &p2,
                 line &l) {
    if (fabs(p1.x - p2.x) < EPS)
        // vertical line
        l = {1.0, 0.0, -p1.x};
    // default values
    else
        l = {-(ld)(p1.y - p2.y) / (p1.x - p2.x), 1.0,
              -(ld)(l.a * p1.x) - p1.y};
}
```

## 4.6 Point Struct And Utils (2d)

```
#include <bits/stdc++.h>
using namespace std;
using ld = long double;

struct point {
    ld x, y;
    int id;
    point(ld x = 0.0, ld y = 0.0, int id = -1)
        : x(x), y(y), id(id) {}

    point& operator+=(const point& t) {
        x += t.x;
        y += t.y;
        return *this;
    }

    point& operator-=(const point& t) {
        x -= t.x;
        y -= t.y;
        return *this;
    }

    point& operator*=(ld t) {
        x *= t;
        y *= t;
        return *this;
    }

    point& operator/=(ld t) {
        x /= t;
        y /= t;
        return *this;
    }

    point operator+(const point& t) const {
```

```
        return point(*this) += t;
    }

    point operator-(const point& t) const {
        return point(*this) -= t;
    }

    point operator*(ld t) const { return point(*this) *= t; }
    point operator/(ld t) const { return point(*this) /= t; }
};

ld dot(point& a, point& b) { return a.x * b.x + a.y * b.y; }

ld norm(point& a) { return dot(a, a); }

ld abs(point a) { return sqrt(norm(a)); }

ld proj(point a, point b) { return dot(a, b) / abs(b); }

ld angle(point a, point b) {
    return acos(dot(a, b) / abs(a) / abs(b));
}

ld cross(point a, point b) { return a.x * b.y - a.y * b.x; }
```

## 4.7 Polygon Lattice Points (Pick's Theorem)

Given a polygon with  $N$  points finds the number of lattice points inside and on boundaries. Time :  $O(N)$

```
ll cross(ll x1, ll y1, ll x2, ll y2) {
    return x1 * y2 - x2 * y1;
}

ll polygonArea(vector<p11>& pts) {
    ll ats = 0;
    for (int i = 2; i < len(pts); i++)
        ats += cross(pts[i].first - pts[0].first,
                     pts[i].second - pts[0].second,
                     pts[i - 1].first - pts[0].first,
                     pts[i - 1].second - pts[0].second);
    return abs(ats / 2ll);
}

ll boundary(vector<p11>& pts) {
    ll ats = pts.size();
    for (int i = 0; i < len(pts); i++) {
        ll deltax =
            (pts[i].first - pts[(i + 1) % pts.size()].first);
        ll deltay =
```

```

        (pts[i].second - pts[(i + 1) % pts.size()].second);
    ats += abs(__gcd(deltax, deltay)) - 1;
}
return ats;
}

pll latticePoints(vector<pll>& pts) {
    ll bounds = boundary(pts);
    ll area = polygonArea(pts);
    ll inside = area + 1ll - bounds / 2ll;

    return {inside, bounds};
}

```

## 4.8 Segment Intersection

```

using ld = long double;

template <typename T = ld>
struct Point {
    T x, y;
    bool is_port;
};

template <typename T = ld>
bool operator==(const Point<T> &a, const Point<T> &b) {
    return a.x == b.x and a.y == b.y;
}

template <typename T = ld>
struct Segment {
    Point<T> p1, p2;
};

template <typename T>
int orientation(Point<T> p, Point<T> q, Point<T> r) {
    int val =
        (q.y - p.y) * (r.x - q.x) - (q.x - p.x) * (r.y - q.y);

}
};

```

## 5.2 Cycle Distances

Given a vertex  $s$  finds the longest cycle that end's in  $s$ , note that the vector **dist** will contain the distance that each vertex  $u$  needs to reach  $s$ .

Time:  $O(N)$

```

using adj = vector<vector<pair<int, ll>>>;
ll cycleDistances(int u, int n, int s, vc &vis, adj &g,
                  vll &dist) {

    vis[u] = 1;

    for (auto [v, d] : g[u]) {
        if (v == s) {
            dist[u] = max(dist[u], d);
            continue;

```

```

        }

        if (vis[v] == 1) {
            continue;
        }

        if (vis[v] == 2) {
            dist[u] = max(dist[u], dist[v] + d);
        } else {
            ll d2 = cycleDistances(v, n, s, vis, g, dist);
            if (d2 != -oo) {
                dist[u] = max(dist[u], d2 + d);
            }
        }
    }
    vis[u] = 2;
    return dist[u];
}

```

## 5.3 SCC (struct)

Build the condensation graph based in the strongly connected components.

tiem:  $O(V + E)$

```

struct SCC {
    int num_sccs = 0;
    vi scc_id;
    vector<set<ll>> gsc;

    SCC(const vi2d& adj)
        : scc_id(len(adj), -1), gsc(len(adj)) {
        int n = len(adj), timer = 1;
        vi tin(n), st;
        st.reserve(n);
        auto dfs = [&](auto&& self, int u) -> int {
            int low = tin[u] = timer++, siz = len(st);
            st.push_back(u);
            for (int v : adj[u])
                if (scc_id[v] < 0)
                    low = min(low, tin[v] ? tin[v] : self(self, v));
            if (tin[u] == low) {
                for (int i = siz; i < len(st); i++)
                    scc_id[st[i]] = num_sccs;
                st.resize(siz);
                num_sccs++;
            }
        };
    }
};

```

```

    return low;
};
for (int i = 0; i < n; i++)
    if (!tin[i]) dfs(dfs, i);

for (int i = 0; i < len(adj); ++i)
    for (auto j : adj[i])
        if (scc_id[i] != scc_id[j])
            gsc[scc_id[i]].emplace(scc_id[j]);
}
};

```

## 5.4 Bellman-Ford (find negative cycle)

Given a directed graph find a negative cycle by running  $n$  iterations, and if the last one produces a relaxation then there is a cycle.

Time:  $O(V \cdot E)$

```

const ll oo = 2500 * 1e9;

using graph = vector<vector<pair<int, ll>>>;
vi negative_cycle(graph &g, int n) {
    vll d(n, oo);
    vi p(n, -1);
    int x = -1;
    d[0] = 0;
    for (int i = 0; i < n; i++) {
        x = -1;
        for (int u = 0; u < n; u++) {
            for (auto &[v, l] : g[u]) {
                if (d[u] + l < d[v]) {
                    d[v] = d[u] + l;
                    p[v] = u;
                    x = v;
                }
            }
        }
    }

    if (x == -1)
        return {};
    else {
        for (int i = 0; i < n; i++) x = p[x];
        vi cycle;
        for (int v = x;; v = p[v]) {
            cycle.eb(v);

```

```

        if (v == x and len(cycle) > 1) break;
    }
    reverse(all(cycle));
    return cycle;
}
}

```

## 5.5 Bellman Ford

Find shortest path from a single source to all other nodes. Can detect negative cycles.

Time:  $O(V \cdot E)$

```

bool bellman_ford(const vector<vector<pair<int, ll>>> &g,
                  int s, vector<ll> &dist) {
    int n = (int)g.size();
    dist.assign(n, LLONG_MAX);

    vector<int> count(n);
    vector<char> in_queue(n);
    queue<int> q;

    dist[s] = 0;
    q.push(s);
    in_queue[s] = true;

    while (not q.empty()) {
        int cur = q.front();
        q.pop();
        in_queue[cur] = false;

        for (auto [to, w] : g[cur]) {
            if (dist[cur] + w < dist[to]) {
                dist[to] = dist[cur] + w;
                if (not in_queue[to]) {
                    q.push(to);
                    in_queue[to] = true;
                    count[to]++;
                    if (count[to] > n) return false;
                }
            }
        }
    }

    return true;
}

```

## 5.6 BFS 01

Similar to a Dijkstra given a weighted graph finds the distance from source  $s$  to every other node (SSSP).

Applicable only when the weight of the edges  $\in \{0, x\}$

Time:  $O(V + E)$

```
vector<pair<ll, int>> adj[maxn];
ll dists[maxn];
int s, n;
void bfs_01() {
    fill(dists, dists + n, oo);
    dist[s] = 0;

    deque<int> q;
    q.emplace_back(s);

    while (not q.empty()) {
        auto u = q.front();
        q.pop_front();

        for (auto [v, w] : adj[u]) {
            if (dist[v] <= dist[u] + w) continue;
            dist[v] = dist[u] + w;
            w ? q.emplace_back(v) : q.emplace_front(v);
        }
    }
}
```

## 5.7 Biconnected Components

Build a vector of vectors, where the  $i$ -th vector correspond to the nodes of the  $i$ -th biconnected component, a biconnected component is a subset of nodes and edges in which there is no cut point, also exist at least two distinct routes in vertex between any two vertex in the same biconnected component.

time:  $O(N + M)$

```
const int maxn(5'00'000);
int tin[maxn], stck[maxn], bcc_cnt, n, top = 0, timer = 1;
vector<int> g[maxn], nodes[maxn];
```

```
int tarjan(int u, int p = -1) {
    int lowu = tin[u] = timer++;
    int son_cnt = 0;
    stck[++top] = u;
    for (auto v : g[u]) {
        if (!tin[v]) {
            son_cnt++;
            int lowx = tarjan(v, u);
            lowu = min(lowu, lowx);
```

```
        if (lowx >= tin[u]) {
            while (top != -1 && stck[top + 1] != v)
                nodes[bcc_cnt].emplace_back(stck[top--]);
            nodes[bcc_cnt++].emplace_back(u);
        }
        else {
            lowu = min(lowu, tin[v]);
        }
    }

    if (p == -1 && son_cnt == 0) {
        nodes[bcc_cnt++].emplace_back(u);
    }

    return lowu;
}

void build_bccs() {
    timer = 1;
    top = -1;
    memset(tin, 0, sizeof(int) * n);
    for (int i = 0; i < n; i++) nodes[i] = {};
    bcc_cnt = 0;

    for (int u = 0; u < n; u++)
        if (!tin[u]) tarjan(u);
}
```

## 5.8 Binary Lifting/Jumping

Given a function/successor graph answers queries of the form which is the node after  $k$  moves starting from  $u$ .

Time: build  $O(N \cdot \text{MAXLOG2})$ , query  $O(\text{MAXLOG2})$ .

```
const int MAXN(2e5), MAXLOG2(30);
int bl[MAXN][MAXLOG2 + 1];
int N;

int jump(int u, ll k) {
    for (int i = 0; i <= MAXLOG2; i++) {
        if (k & (1ll << i)) u = bl[u][i];
    }
    return u;
}

void build() {
    for (int i = 1; i <= MAXLOG2; i++) {
```

```

    for (int j = 0; j < N; j++) {
        bl[j][i] = bl[bl[j][i] - 1][i - 1];
    }
}
}

```

## 5.9 Block Cut Tree

```

struct block_cut_tree {
    int n;
    vector<int> id, is_cutpoint, tin, low, stk;
    vector<vector<int>> comps, tree;
    block_cut_tree(vector<vector<int>> &g)
        : n(g.size()), id(n), is_cutpoint(n), tin(n), low(n) {
        // build comps
        for (int i = 0; i < n; i++) {
            if (!tin[i]) {
                int timer = 0;
                dfs(i, -1, timer, g);
            }
        }

        int node_id = 0;
        for (int u = 0; u < n; u++) {
            if (is_cutpoint[u]) {
                id[u] = node_id++;
                tree.push_back({});
            }
        }

        for (auto &comp : comps) {
            int node = node_id++;
            tree.push_back({});
            for (int u : comp) {
                if (!is_cutpoint[u]) {
                    id[u] = node;
                } else {
                    tree[node].emplace_back(id[u]);
                    tree[id[u]].emplace_back(node);
                }
            }
        }
    }

    void dfs(int u, int p, int &timer,

```

```

        vector<vector<int>> &g) {
        tin[u] = low[u] = ++timer;
        stk.emplace_back(u);

        for (auto v : g[u]) {
            if (v == p) continue;
            if (!tin[v]) {
                dfs(v, u, timer, g);
                low[u] = min(low[u], low[v]);
                if (low[v] >= tin[u]) {
                    is_cutpoint[u] = (tin[u] > 1 or tin[v] > 2);
                    comps.push_back({u});
                    while (comps.back().back() != v) {
                        comps.back().emplace_back(stk.back());
                        stk.pop_back();
                    }
                }
            } else {
                low[u] = min(low[u], tin[v]);
            }
        }
    };
}

```

## 5.10 Check Bipartite

$O(V)$

```

vi2d G;
int N, M;

bool check() {
    vi side(N, -1);
    queue<int> q;
    for (int st = 0; st < N; st++) {
        if (side[st] == -1) {
            q.emplace(st);
            side[st] = 0;
            while (not q.empty()) {
                int u = q.front();
                q.pop();
                for (auto v : G[u]) {
                    if (side[v] == -1) {
                        side[v] = side[u] ^ 1;
                        q.push(v);
                    } else if (side[u] == side[v])
                        return false;
                }
            }
        }
    }
}

```

```

    }
}
return true;
}

```

## 5.11 Dijkstra (k Shortest Paths)

```

const ll oo = 1e9 * 1e5 + 1;
using adj = vector<vector<pll>>;
vector<priority_queue<ll>> dijkstra(
    const vector<vector<pll>> &g, int n, int s, int k) {
    priority_queue<pll, vector<pll>, greater<pll>> pq;

    vector<priority_queue<ll>> dist(n);
    dist[0].emplace(0);
    pq.emplace(0, s);
    while (!pq.empty()) {
        auto [d1, v] = pq.top();
        pq.pop();

        if (not dist[v].empty() and dist[v].top() < d1)
            continue;

        for (auto [d2, u] : g[v]) {
            if (len(dist[u]) < k) {

                    dist[u].pop();
                    dist[u].emplace(d1 + d2);
                    pq.emplace(d2 + d1, u);
                }
            }
        }
    }
    return dist;
}

```

## 5.12 Dijkstra

Finds the shortest path from  $s$  to every other node, and keep the 'parent' tracking.  
Time:  $O(E \cdot \log V)$

```

pair<vll, vi> dijkstra(const vector<vector<pll>> &g, int n,

```

```

        int s) {
    priority_queue<pll, vector<pll>, greater<pll>> pq;
    vll dist(n, oo);
    vi p(n, -1);
    pq.emplace(0, s);
    dist[s] = 0;
    while (!pq.empty()) {
        auto [d1, v] = pq.top();
        pq.pop();
        if (dist[v] < d1) continue;

        for (auto [d2, u] : g[v]) {
            if (dist[u] > d1 + d2) {
                dist[u] = d1 + d2;
                p[u] = v;
                pq.emplace(dist[u], u);
            }
        }
    }
    return {dist, p};
}

```

## 5.13 Disjoint Edges Path (Maxflow)

Given a directed graph find's every path with disjoint edges that starts at  $s$  and ends at  $t$   
Time :  $O(E \cdot V^2)$

```

struct DisjointPaths {
    int n;
    vi2d g, capacity;
    vector<vc> isedge;

    DisjointPaths(int _n)
        : n(_n), g(n), capacity(n, vi(n)), isedge(n, vc(n)) {}

    void add(int u, int v, int w = 1) {
        g[u].emplace_back(v);
        g[v].emplace_back(u);
        capacity[u][v] += w;
        isedge[u][v] = true;
    }

    // finds the new flow to insert
    int bfs(int s, int t, vi &parent) {
        fill(all(parent), -1);
        parent[s] = -2;

```

```

}

```

## 5.17 Find Articulation/Cut Points

Given an **undirected** graph find its articulation points.

**articulation point (or cut vertex)**: is defined as a **vertex** which, when removed along with associated edges, increases the number of connected components in the graph.

A vertex  $u$  can be an articulation point if and only if it has at least 2 adjacent vertices.

Time:  $O(N + M)$

```

const int MAXN(100);
int N;
vi2d G;
int timer;
int tin[MAXN], low[MAXN];
set<int> cpoints;

int dfs(int u, int p = -1) {
    int cnt = 0;
    low[u] = tin[u] = timer++;
    for (auto v : G[u]) {
        if (not tin[v]) {
            cnt++;
            dfs(v, u);

            if (low[v] >= tin[u]) cpoints.insert(u);
            low[u] = min(low[u], low[v]);
        } else if (v != p)
            low[u] = min(low[u], tin[v]);
    }

    return cnt;
}

void getCutPoints() {
    memset(low, 0, sizeof(low));
    memset(tin, 0, sizeof(tin));
    cpoints.clear();

    timer = 1;
    for (int i = 0; i < N; i++) {
        if (tin[i]) continue;
        int cnt = dfs(i);
        if (cnt == 1) cpoints.erase(i);
    }
}

```

## 5.18 Find Bridge Tree Components

$label2CC(u, p)$  finds the 2-edge connected component of every node.

notes: 0 indexed, it also works with not simple graphs.

time:  $O(n + m)$

```

const int maxn(3'000'000);
int tin[maxn], compId[maxn], qtdComps;
vi g[maxn], stck;

```

```

int n;
int dfs(int u, int p = -1) {
    int low = tin[u] = len(stck);
    stck.emplace_back(u);

    bool multEdge = false;

## 5.20 Find Bridges

Find every bridge in a **undirected** connected graph.

**bridge:** A bridge is defined as an **edge** which, when removed, increases the number of connected components in the graph.

**Remember to read the graph as pair where the second is the id of the edge !**

Time:  $O(N + M)$

```

const int MAXN(10000), MAXM(100000);
int N, M, clk, tin[MAXN], low[MAXN], isBridge[MAXM];
vector<pii> G[MAXN];

void dfs(int u, int p = -1) {
    tin[u] = low[u] = clk++;

    for (auto [v, i] : G[u]) {
        if (v == p) continue;
        if (tin[v]) {
            low[u] = min(low[u], tin[v]);
        } else {
            dfs(v, u);
            low[u] = min(low[u], low[v]);
            if (low[v] > tin[u]) {
                isBridge[i] = 1;
            }
        }
    }
}

void findBridges() {
    fill(tin, tin + N, 0);
    fill(low, low + N, 0);
    fill(isBridge, isBridge + M, 0);
    clk = 1;
}

```

```

    for (int i = 0; i < N; i++) {
        if (!tin[i]) dfs(i);
    }
}

```

## 5.21 Find Centroid

Given a tree (don't forget to make it 'undirected'), find it's centroids.

Time:  $O(V)$

```

void dfs(int u, int p, int n, vi2d &g, vi &sz,
        vi &centroid) {
    sz[u] = 1;

    bool iscentroid = true;
    for (auto v : g[u])
        if (v != p) {
            dfs(v, u, n, g, sz, centroid);
            if (sz[v] > n / 2) iscentroid = false;
            sz[u] += sz[v];
        }

    if (n - sz[u] > n / 2) iscentroid = false;
    if (iscentroid) centroid.eb(u);
}

vi getCentroid(vi2d &g, int n) {
    vi centroid;
    vi sz(n);
    dfs(0, -1, n, g, sz, centroid);
    return centroid;
}

```

## 5.22 Floyd Warshall

Simply finds the minimal distance for each node to every other node.  $O(V^3)$

```

vector<vll> floyd_warshall(const vector<vll> &adj, ll n) {
    auto dist = adj;

    for (int i = 0; i < n; ++i) {
        for (int j = 0; j < n; ++j) {
            for (int k = 0; k < n; ++k) {
                dist[j][k] =
                    min(dist[j][k], dist[j][i] + dist[i][k]);
            }
        }
    }
}

```

```

    return dist;
}

```

## 5.23 Functional/Successor Graph

Given a functional graph find the vertex after  $k$  moves starting at  $u$  and also the distance between  $u$  and  $v$ , if it's impossible to reach  $v$  starting at  $u$  returns -1.

Time: build  $O(N \cdot \text{MAXLOG2})$ , kth  $O(\text{MAXLOG2})$ , dist  $O(\text{MAXLOG2})$

```

const int MAXN(2'000'000), MAXLOG2(24);
int N;
vi2d succ(MAXN, vi(MAXLOG2 + 1));
vi dst(MAXN, 0);

int vis[MAXN];
void dfsbuild(int u) {
    if (vis[u]) return;
    vis[u] = 1;
    int v = succ[u][0];
    dfsbuild(v);
    dst[u] = dst[v] + 1;
}

void build() {
    for (int i = 0; i < N; i++) {
        if (not vis[i]) dfsbuild(i);
    }

    for (int k = 1; k <= MAXLOG2; k++) {
        for (int i = 0; i < N; i++) {
            succ[i][k] = succ[succ[i][k - 1]][k - 1];
        }
    }
}

int kth(int u, ll k) {
    if (k <= 0) return u;
    for (int i = 0; i <= MAXLOG2; i++)
        if ((1ll << i) & k) u = succ[u][i];
    return u;
}

int dist(int u, int v) {
    int cu = kth(u, dst[u]);
    if (kth(u, dst[u] - dst[v]) == v)
        return dst[u] - dst[v];
}

```

```

else if (kth(cu, dst[cu] - dst[v]) == v)
    return dst[u] + (dst[cu] - dst[v]);
else
    return -1;
}

```

## 5.24 Graph Cycle (directed)

Given a directed graph finds a cycle (or not).

Time :  $O(E)$

```

bool dfs(int v, vi2d &adj, vc &visited, vi &parent,
         vc &color, int &cycle_start, int &cycle_end) {
    color[v] = 1;
    for (int u : adj[v]) {

        if (v == p) continue;

        ansd[v] = ansd[u] - cnt[v] + (n - cnt[v]);
        dfs(v, u, g, cnt, ansd, n);
    }
}

vll fromToAll(vi2d &g, int n) {
    vll d(n);
    vll cnt(n, 1);
    getRoot(0, -1, g, d, cnt);

    vll ansdist(n);
    ansdist[0] = d[0];

    dfs(0, -1, g, cnt, ansdist, n);
    return ansdist;
}

```

### 5.39 Topological Labelling (Kahn)

The same thing as topological sorting but over every possible order gives lexicographically smaller  
 Time:  $O(E + V \cdot \log V)$

```

const int MAXN(1'00'000);
int OUTCNT[MAXN];
vi2d GIN(MAXN);
int N;

vi toposort() {
    vi order;
    priority_queue<int> q;

    for (int i = 0; i < N; i++)
        if (!OUTCNT[i]) q.emplace(i);

    while (!q.empty()) {
        auto u = q.top();
        q.pop();
    }
}

```

```

    order.emplace_back(u);
    for (auto v : GIN[u]) {
        OUTCNT[v]--;
        if (OUTCNT[v] == 0) q.emplace(v);
    }
}

reverse(all(order));
return len(order) == N ? order : vi();
}

```

## 5.40 Topological Sorting (Kahn)

Finds the topological sorting in a **DAG**, if the given graph is not a **DAG** than an empty vector is returned, need to 'initialize' the **INCNT** as you build the graph.

Time:  $O(V + E)$

```

const int MAXN(2'00'000);
int INCNT[MAXN];
vi2d GOUT(MAXN);
int N;

vi toposort() {
    vi order;
    queue<int> q;

    for (int i = 0; i < N; i++)
        if (!INCNT[i]) q.emplace(i);

    while (!q.empty()) {
        auto u = q.front();
        q.pop();
        order.emplace_back(u);
        for (auto v : GOUT[u]) {
            INCNT[v]--;
            if (INCNT[v] == 0) q.emplace(v);
        }
    }

    return len(order) == N ? order : vi();
}

```

## 5.41 Topological Sorting (Tarjan)

Finds a the topological order for the graph, if there is no such order it means the graph is cyclic, then it returns an empty vector

$O(V + E)$

```

const int maxn(1'00'000);
int n, m;
vi g[maxn];

int not_found = 0, found = 1, processed = 2;
int state[maxn];

bool dfs(int u, vi &order) {
    if (state[u] == processed) return true;
    if (state[u] == found) return false;

    state[u] = found;

    for (auto v : g[u]) {
        if (!dfs(v, order)) return false;
    }

    state[u] = processed;
    order.emplace_back(u);

    return true;
}

vi topo_sort() {
    vi order;
    memset(state, 0, sizeof state);

    for (int u = 0; u < n; u++) {
        if (state[u] == not_found and not dfs(u, order))
            return {};
    }

    reverse(all(order));
    return order;
}

```

## 5.42 Tree Diameter (DP)

```

const int MAXN(1'000'000);
int N;
vi G[MAXN];

int diameter, toLeaf[MAXN];
void calcDiameter(int u = 0, int p = -1) {
    int d1, d2;

```

```

d1 = d2 = -1;

for (auto v : G[u]) {
    if (v != p) {
        calcDiameter(v, u);
        d1 = max(d1, toLeaf[v]);
        tie(d1, d2) = minmax({d1, d2});
    }
}
toLeaf[u] = d2 + 1;
diameter = max(diameter, d1 + d2 + 2);
}

```

### 5.43 Tree Isomorphism (not rooted)

Two trees are considered **isomorphic** if the hash given by *thash()* is the same.  
Time:  $O(V \cdot \log V)$

```
map<vi, int> mphash;
```

```

struct Tree {
    int n;
    vi2d g;
    vi sz, cs;

    Tree(int n_) : n(n_), g(n), sz(n) {}

    void add_edge(int u, int v) {
        g[u].emplace_back(v);
        g[v].emplace_back(u);
    }

    void dfs_centroid(int v, int p) {
        sz[v] = 1;
        bool cent = true;
        for (int u : g[v])
            if (u != p) {
                dfs_centroid(u, v);
                sz[v] += sz[u];
                cent &= not(sz[u] > n / 2);
            }
        if (cent and n - sz[v] <= n / 2) cs.push_back(v);
    }

    int fhash(int v, int p) {
        vi h;
        for (int u : g[v])

```

```

            if (u != p) h.push_back(fhash(u, v));
        sort(all(h));
        if (!mphash.count(h)) mphash[h] = mphash.size();
        return mphash[h];
    }

    ll thash() {
        cs.clear();
        dfs_centroid(0, -1);
        if (cs.size() == 1) return fhash(cs[0], -1);
        ll h1 = fhash(cs[0], cs[1]), h2 = fhash(cs[1], cs[0]);
        return (min(h1, h2) << 3011) + max(h1, h2);
    }
};

```

### 5.44 Tree Isomorphism (rooted)

Given a rooted tree find the hash of each subtree, if two roots of two distinct trees have the same hash they are considered isomorphic  
hash first time in  $O(\log N_v \cdot N_v)$  where  $(N_v)$  is the of the subtree of  $v$

```

map<vi, int> hasher;
int hs = 0;
struct RootedTreeIso {
    int n;
    vi2d adj;
    vi hashes;
    RootedTreeIso(int n_) : n(n_), adj(n), hashes(n, -1){};

    void add_edge(int u, int v) {
        adj[u].emplace_back(v);
        adj[v].emplace_back(u);
    }

    int hash(int u, int p = -1) {
        if (hashes[u] != -1) return hashes[u];

        vi children;
        for (auto v : adj[u])
            if (v != p) children.emplace_back(hash(v, u));

        sort(all(children));
        if (!hasher.count(children)) hasher[children] = hs++;

        return hashes[u] = hasher[children];
    }
}

```

```
};
```

## 5.45 Tree Maximum Distance

Returns the maximum distance from every node to any other node in the tree.

$O(6V) = O(V)$

```
pll mostDistantFrom(const vector<vll> &adj, ll n, ll root) {
    // O(V)
    // 0 indexed
    ll mostDistantNode = root;
    ll nodeDistance = 0;
    queue<pll> q;
    vector<char> vis(n);
    q.emplace(root, 0);
    vis[root] = true;
    while (!q.empty()) {
        auto [node, dist] = q.front();
        q.pop();
        if (dist > nodeDistance) {
            nodeDistance = dist;
            mostDistantNode = node;
        }
        for (auto u : adj[node]) {
            if (!vis[u]) {
                vis[u] = true;
                q.emplace(u, dist + 1);
            }
        }
    }
    return {mostDistantNode, nodeDistance};
}

ll twoNodesDist(const vector<vll> &adj, ll n, ll a, ll b) {
    queue<pll> q;
    vector<char> vis(n);
    q.emplace(a, 0);

return ans;
}

```

## 5.46 Tree Flatten

```

void tree_flatten(const vector<vector<int>> &g, int u,
                 int p, vector<int> &pre, vector<int> &pos,
                 int &idx) {
    ++idx;
    pre.push_back(u);
    for (auto x : g[u])
        if (x != p) tree_flatten(g, x, u, pre, pos, idx);
    pos[u] = idx;
}

```

```

pair<vector<int>, vector<int>> tree_flatten(
    const vector<vector<int>> &g, int root = 0) {
    vector<int> first(g.size()), last(g.size()), pre;
    int timer = -1;
    tree_flatten(g, root, -1, pre, last, timer);
    for (int i = 0; i < (int)g.size(); i++) first[pre[i]] = i;
    return {first, last};
}

```

# 6 Math

## 6.1 GCD (with factorization)

$O(\sqrt{n})$  due to factorization.

```

ll gcd_with_factorization(ll a, ll b) {
    map<ll, ll> fa = factorization(a);
    map<ll, ll> fb = factorization(b);
    ll ans = 1;
    for (auto fai : fa) {
        ll k = min(fai.second, fb[fai.first]);
        while (k--) ans *= fai.first;
    }
    return ans;
}

```

## 6.2 GCD

```

ll gcd(ll a, ll b) { return b ? gcd(b, a % b) : a; }

```

## 6.3 LCM (with factorization)

$O(\sqrt{n})$  due to factorization.

```

ll lcm_with_factorization(ll a, ll b) {
    map<ll, ll> fa = factorization(a);
    map<ll, ll> fb = factorization(b);
    ll ans = 1;
    for (auto fai : fa) {
        ll k = max(fai.second, fb[fai.first]);
        while (k--) ans *= fai.first;
    }
    return ans;
}

```

## 6.4 LCM

```

ll gcd(ll a, ll b) { return b ? gcd(b, a % b) : a; }
ll lcm(ll a, ll b) { return a / gcd(a, b) * b; }

```

## 6.5 Arithmetic Progression Sum

- $s$  : first term
- $d$  : common difference
- $n$  : number of terms

```

ll arithmeticProgressionSum(ll s, ll d, ll n) {
    return (s + (s + d * (n - 1))) * n / 2ll;
}

```

## 6.6 Binomial MOD

Precompute every factorial until  $maxn$  ( $O(maxn)$ ) allowing to answer the  $\binom{n}{k}$  in  $O(\log mod)$  time, due to the fastpow. Note that it needs  $O(maxn)$  in memory.

```

const ll MOD = 1e9 + 7;
const ll MAXN = 1'000'000;
ll FACT[MAXN + 1];
void precompute() {
    #warning Remember to call precompute before use binommod !
    FACT[0] = 1;
    for (ll i = 1; i <= MAXN; i++) {
        FACT[i] = (FACT[i - 1] * i) % MOD;
    }
}

```

```

ll fpow(ll a, ll k) {
    ll ret = 1;
    while (k) {

```

```

    if (k & 1) ret = (ret * a) % MOD;
    a = (a * a) % MOD;
    k >>= 1;
}
return ret;
}

ll binommod(ll n, ll k) {
    ll upper = FACT[n];
    ll lower = (FACT[k] * FACT[n - k]) % MOD;
    return (upper * fpow(lower, MOD - 2ll)) % MOD;
}

```

## 6.7 Binomial

$O(nm)$  time,  $O(m)$  space  
Equal to  $n$  choose  $k$

```

ll binom(ll n, ll k) {
    if (k > n) return 0;
    vll dp(k + 1, 0);
    dp[0] = 1;
    for (ll i = 1; i <= n; i++)
        for (ll j = k; j > 0; j--) dp[j] = dp[j] + dp[j - 1];
    return dp[k];
}

```

## 6.8 Chinese Remainder Theorem

Finds the solution  $x$  to the  $n$  modular equations.

$$x \equiv a_1 \pmod{m_1}$$

...

$$x \equiv a_n \pmod{m_n}$$

The  $m_i$  don't need to be coprime, if there is no solution then it returns -1.

```

tuple<ll, ll, ll> ext_gcd(ll a, ll b) {
    if (!a) return {b, 0, 1};
    auto [g, x, y] = ext_gcd(b % a, a);
    return {g, y - b / a * x, x};
}

```

```

template <typename T = ll>
struct crt {
    T a, m;

    crt() : a(0), m(1) {}

```

```

    crt(T a_, T m_) : a(a_), m(m_) {}
    crt operator*(crt C) {
        auto [g, x, y] = ext_gcd(m, C.m);
        if ((a - C.a) % g != 0) a = -1;
        if (a == -1 or C.a == -1) return crt(-1, 0);
        T lcm = m / g * C.m;
        T ans = a + (x * (C.a - a) / g % (C.m / g)) * m;
        return crt((ans % lcm + lcm) % lcm, lcm);
    }
};

template <typename T = ll>
struct Congruence {
    T a, m;
};

template <typename T = ll>
T chinese_remainder_theorem(
    const vector<Congruence<T>> &equations) {
    crt<T> ans;

    for (auto &[a_, m_] : equations) {
        ans = ans * crt<T>(a_, m_);
    }

    return ans.a;
}

```

## 6.9 Derangement / Matching Problem

Computes the derangement of  $N$ , which is given by the formula :

$$D_N = N! \left(1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \dots + (-1)^N \frac{1}{N!}\right)$$

time:  $O(N)$

```

#warning Remember to call precompute !
const ll MOD = 1e9 + 7;
const int MAXN(1'000'000);
ll fats[MAXN + 1];
void precompute() {
    fats[0] = 1;
    for (ll i = 1; i <= MAXN; i++) {
        fats[i] = (fats[i - 1] * i) % MOD;
    }
}

```

```

ll fastpow(ll a, ll p, ll m) {

```

```

11 ret = 1;
while (p) {
    if (p & 1) ret = (ret * a) % MOD;
    p >>= 1;
    a = (a * a) % MOD;
}
return ret;
}

11 divmod(11 a, 11 b) {
    return (a * fastpow(b, MOD - 2, MOD)) % MOD;
}

11 derangement(const 11 n) {
    11 ans = fats[n];
    for (11 i = 1; i <= n; i++) {
        11 k = divmod(fats[n], fats[i]);
        if (i & 1) {
            ans = (ans - k + MOD) % MOD;
        } else {
            ans = (ans + k) % MOD;
        }
    }
    return ans;
}

```

## 6.10 Euler phi $\varphi(n)$ (in range)

Computes the number of positive integers less than  $n$  that are coprimes with  $n$ , in the range  $[1, n]$ , in  $O(N \log N)$ .

```

const int MAX = 1e6;
vi range_phi(int n) {
    bitset<MAX> sieve;
    vi phi(n + 1);

    iota(phi.begin(), phi.end(), 0);
    sieve.set();

    for (int p = 2; p <= n; p += 2) phi[p] /= 2;
    for (int p = 3; p <= n; p += 2) {
        if (sieve[p]) {
            for (int j = p; j <= n; j += p) {
                sieve[j] = false;
                phi[j] /= p;
                phi[j] *= (p - 1);
            }
        }
    }
}

```

```

    }
}

return phi;
}

```

## 6.11 Euler phi $\varphi(n)$

Computes the number of positive integers less than  $n$  that are coprimes with  $n$ , in  $O(\sqrt{N})$ .

```

int phi(int n) {
    if (n == 1) return 1;

    auto fs = factorization(n); // a vector of pair or a map
    auto res = n;

    for (auto [p, k] : fs) {
        res /= p;
        res *= (p - 1);
    }

    return res;
}

```

## 6.12 Factorial Factorization

Computes the factorization of  $n!$  in  $\pi(N) * \log n$

```

// O(logN)
11 E(11 n, 11 p) {
    11 k = 0, b = p;
    while (b <= n) {
        k += n / b;
        b *= p;
    }
    return k;
}

// O(pi(N)*logN)
map<11, 11> factorial_factorization(11 n,
                                   const v11 &primes) {

    map<11, 11> fs;
    for (const auto &p : primes) {
        if (p > n) break;
        fs[p] = E(n, p);
    }
}

```

```

}
return fs;
}

```

## 6.13 Factorial

```

const ll MAX = 18;
vll fv(MAX, -1);
ll factorial(ll n) {
    if (fv[n] != -1) return fv[n];
    if (n == 0) return 1;
    return n * factorial(n - 1);
}

```

## 6.14 Factorization (Pollard Rho)

Factorizes a number into its prime factors in  $O(n^{\frac{1}{4}} * \log(n))$ .

```

ll mul(ll a, ll b, ll m) {
    ll ret = a * b - (ll)((ld)1 / m * a * b + 0.5) * m;
    return ret < 0 ? ret + m : ret;
}

ll pow(ll a, ll b, ll m) {
    ll ans = 1;
    for (; b > 0; b /= 211, a = mul(a, a, m)) {
        if (b % 211 == 1) ans = mul(ans, a, m);
    }
    return ans;
}

    if (prime(n)) return {n};
    ll d = rho(n);
    vll l = fact(d), r = fact(n / d);
    l.insert(l.end(), r.begin(), r.end());
    return l;
}

```

## 6.15 Factorization

Computes the factorization of n in  $O(\sqrt{n})$ .

```

map<ll, ll> factorization(ll n) {
    map<ll, ll> ans;
    for (ll i = 2; i * i <= n; i++) {
        ll count = 0;
        for (; n % i == 0; count++, n /= i)
            ;
        if (count) ans[i] = count;
    }
    if (n > 1) ans[n]++;
    return ans;
}

```

## 6.16 Fast pow

Computes  $a^b \pmod m$  in  $O(\log N)$ .

```
ll fpow(ll a, ll b, ll m) {
    ll ret = 1;
    while (b) {
        if (b & 1) ret = (ret * a) % m;
        b >>= 1;
        a = (a * a) % m;
    }
    return ret;
}

## 8 Searching

### 8.1 Meet in the middle

Answers the query how many subsets of the vector  $xs$  have sum equal  $x$ .

Time:  $O(N \cdot 2^{\frac{N}{2}})$

```

vll get_subset_sums(int l, int r, vll &a) {
    int len = r - l + 1;
    vll res;

    for (int i = 0; i < (1 << len); i++) {
        ll sum = 0;
        for (int j = 0; j < len; j++) {
            if (i & (1 << j)) {
                sum += a[l + j];
            }
        }
        res.push_back(sum);
    }
}

```

```

    return res;
};

ll count(vll &xs, ll x) {
    int n = len(xs);
    vll left = get_subset_sums(0, n / 2 - 1, xs);
    vll right = get_subset_sums(n / 2, n - 1, xs);
    sort(all(left));
    sort(all(right));
    ll ans = 0;
    for (ll i : left) {
        auto start_index =
            lower_bound(right.begin(), right.end(), x - i) -
            right.begin();
        auto end_index =
            upper_bound(right.begin(), right.end(), x - i) -
            right.begin();
        ans += end_index - start_index;
    }
    return ans;
}

```

## 8.2 Ternary Search Recursive

```

const double eps = 1e-6;

// IT MUST BE AN UNIMODAL FUNCTION
double f(int x) { return x * x + 2 * x + 4; }

double ternary_search(double l, double r) {
    if (fabs(f(l) - f(r)) < eps)
        return f((l + (r - l) / 2.0));

    auto third = (r - l) / 3.0;
    auto m1 = l + third;
    auto m2 = r - third;

    // change the signal to find the maximum point.
    return m1 < m2 ? ternary_search(m1, r)
        : ternary_search(l, m2);
}

```

## 9 Strings

### 9.1 Count Distinct Anagrams

```

const ll MOD = 1e9 + 7;
const int maxn = 1e6;
vll fs(maxn + 1);

    // }
};

```

## 9.6 K-th digit in digit string

Find the  $k$ -th digit in a *digit string*, only works for  $1 \leq k \leq 10^{18}$  !  
 Time: precompute  $O(1)$ , query  $O(1)$

```

using ull = vector<ull>;
ull pow10;
vector<array<ull, 4>> memo;
void precompute(int maxpow = 18) {
    ull qtd = 1;
    ull start = 1;
    ull end = 9;
    ull curlenght = 9;
    ull startstr = 1;
    ull endstr = 9;

    for (ull i = 0, j = 1ll; (int)i < maxpow; i++, j *= 10ll)
        pow10.eb(j);

    for (ull i = 0; i < maxpow - 1ull; i++) {
        memo.push_back({start, end, startstr, endstr});

        start = end + 1ll;
        end = end + (9ll * pow10[qtd]);
        curlenght = end - start + 1ull;

        qtd++;
        startstr = endstr + 1ull;
        endstr = (endstr + 1ull) + (curlenght)*qtd - 1ull;
    }
}

char kthDigit(ull k) {
    int qtd = 1;
    for (auto [s, e, ss, es] : memo) {
        if (k >= ss and k <= es) {
            ull pos = k - ss;
            ull index = pos / qtd;
            ull nmr = s + index;
            int i = k - ss - qtd * index;

            return ((nmr / pow10[qtd - i - 1]) % 10) + '0';
        }
        qtd++;
    }

    return 'X';
}

```

## 9.7 Longest Palindrome Substring (Manacher)

Finds the longest palindrome substring, manacher returns a vector where the  $i$ -th position is how much is possible to grow the string to the left and the right of  $i$  and keep it a palindrome.

Time:  $O(N)$

```

vi manacher(const string &s) {
    int n = len(s) - 2;
    vi p(n + 2);
    int l = 1, r = 1;
    for (int i = 1; i <= n; i++) {
        p[i] = max(0, min(r - i, p[l + (r - i)]));
        while (s[i - p[i]] == s[i + p[i]]) p[i]++;
        if (i + p[i] > r) l = i - p[i], r = i + p[i];
        p[i]--;
    }
    return p;
}

string longest_palindrome(const string &s) {
    string t("$#");
    for (auto c : s) t.push_back(c), t.push_back('#');
    t.push_back('^');
    vi xs = manacher(t);
    int mpos = max_element(all(xs)) - xs.begin();
    string p;
    for (int k = xs[mpos], i = mpos - k; i <= mpos + k; i++)
        if (t[i] != '#') p.push_back(t[i]);
    return p;
}

```

## 9.8 Longest Palindrome

```
