1.3 Bitree 2D

Given a 2d array allow you to sum *val* to the position (x, y) and find the sum of the rectangle with left top corner $(x1, y1)$ and right bottom corner $(x2, y2)$

Update and query 1 indexed !

Time: update $O(logn^2)$, query $O(logn^2)$

```cpp
struct Bit2d {
  int n;
  vll2d bit;
  Bit2d(int ni) : n(ni), bit(n + 1, vll(n + 1)) {}
  Bit2d(int ni, vll2d &xs) : n(ni), bit(n + 1, vll(n + 1)) {
    for (int i = 1; i <= n; i++) {

1.5 Convex Hull Trick / Line Container

Container where you can add lines of the form $mx + b$, and query maximum value at point x.

insert_line(m, b) inserts the line $m \cdot x + b$ in the container.
eval(x) find the highest value among all lines in the point x.
both in $O(\log N)$

```cpp
const ll LLINF = 1e18;
const ll is_query = -LLINF;
struct Line {
  ll m, b;
  mutable function<const Line*()> succ;
  bool operator<(const Line& rhs) const {
    if (rhs.b != is_query) return m < rhs.m;
    const Line* s = succ();
    if (!s) return 0;
    ll x = rhs.m;
    return b - s->b < (s->m - m) * x;
  }
};
struct Cht : public multiset<Line> {  // maintain max m*x+b

1.8   Lichao Tree (dynamic)

Lichao Tree that creates the nodes dynamically, allowing to query and update from range $[MAXL, MAXR]$
$query(x)$: find the highest point among all lines in the structure
$add(a, b)$: add a line of form $y = ax + b$ in the structure
$addSegment(a, b, l, r)$: add a line segment of form $y = ax + b$ which covers from range $[l, r]$
time: $O(\log N)$

1.9   Merge Sort Tree

Like a segment tree but each node st_i stores a sorted subarray

- $inrange(l, r, a, b)$: counts the number of elements $x \in [l, r]$ such that $a \le x \le b$.

Memory: $O(n \log N)$ Time: build $O(N \log N)$, inrange $O(\log N)$

```cpp
template <class T>
struct MergeSortTree {
  int n;
  vector<vector<T>> st;
  MergeSortTree(vector<T> &xs) : n(len(xs)), st(n << 1) {
    for (int i = 0; i < n; i++)
      st[i + n] = vector<T>({xs[i]});
```

```cpp
    for (int i = n - 1; i > 0; i--) {
      st[i].resize(len(st[i << 1]) + len(st[i << 1 | 1]));
      merge(all(st[i << 1]), all(st[i << 1 | 1]),
            st[i].begin());
    }
  }
  int count(int i, T a, T b) {
    return upper_bound(all(st[i]), b) -
           lower_bound(all(st[i]), a);
  }
  int inrange(int l, int r, T a, T b) {
    int ans = 0;

    for (l += n, r += n + 1; l < r; l >>= 1, r >>= 1) {
      if (l & 1) ans += count(l++, a, b);
      if (r & 1) ans += count(--r, a, b);
    }

    return ans;
  }
};
```

1.10   Ordered Set

If you need an ordered **multi**set you may add an id to each value. Using greater_equal, or less_equal is considered undefined behavior.

- **order_of_key (k)** : Number of items strictly smaller/greater than k .
- **find_by_order(k)** : K-th element in a set (counting from zero).

```cpp
#include <ext/pb_ds/assoc_container.hpp>
#include <ext/pb_ds/tree_policy.hpp>
using namespace __gnu_pbds;

template <typename T>
using ordered_set = tree<T, null_type, less<T>, rb_tree_tag,
                         tree_order_statistics_node_update>;
```

1.11   Prefix Sum 2D

Given an 2d array with n lines and m columns, find the sum of the subarray that have the left upper corner at $(x1, y1)$ and right bottom corner at $(x2, y2)$.
Time: build $O(n \cdot m)$, query $O(1)$.

```cpp
struct psum2d {
```

```cpp
  vll2d s;
  vll2d psum;
  psum2d(vll2d &grid, int n, int m)
    : s(n + 1, vll(m + 1)), psum(n + 1, vll(m + 1)) {
    for (int i = 1; i <= n; i++)
      for (int j = 1; j <= m; j++)
        s[i][j] = s[i][j - 1] + grid[i][j];

    for (int i = 1; i <= n; i++)
      for (int j = 1; j <= m; j++)
        psum[i][j] = psum[i - 1][j] + s[i][j];
  }

  ll query(int x1, int y1, int x2, int y2) {
    ll ans = psum[x2][y2] + psum[x1 - 1][y1 - 1];
    ans -= psum[x2][y1 - 1] + psum[x1 - 1][y2];
    return ans;
  }
};
```

1.12   SegTree Range Sum Query Range PA sum/set Update

Makes arithmetic progression updates in range and sum queries.
Considering $PA(A, R) = [A + R, A + 2R, A + 3R, ...]$

- **update_set(l, r, A, R):** sets [l, r] to PA(A, R)
- **update_add(l, r, A, R):** sum PA(A, R) in [l, r]
- **query(l, r):** sum in range [l, r]

<mark>0 indexed !</mark>
Time: build $O(n)$, updates and queries $O(log n)$

```cpp
const ll oo = 1e18;
struct SegTree {
  struct Data {
    ll sum;
    ll set_a, set_r, add_a, add_r;

2 Dynamic programming

2.1 Binary Knapsack (bottom up)

Given the points each element have, and it repespective cost, computes the maximum points we can get if we can ignore/choose an element, in such way that the sum of costs don't exceed the maximum cost allowed

Time and space: $O(N * W)$

the vectors VS and WS starts at one, so it need an empty value at index 0.

```cpp
const int MAXN(1'000), MAXCOST(1'000 * 20);
ll dp[MAXN + 1][MAXCOST + 1];
bool ps[MAXN + 1][MAXCOST + 1];
pair<ll, vi> knapsack(const vll &points, const vi &costs,
                      int maxCost) {
  int n = len(points) - 1;  // ELEMENTS START AT INDEX 1 !

  for (int m = 0; m <= maxCost; m++) {
    dp[0][m] = 0;
  }

  for (int i = 1; i <= n; i++) {
    dp[i][0] = dp[i - 1][0] + (costs[i] == 0) * points[i];
    ps[i][0] = costs[i] == 0;
  }

  for (int i = 1; i <= n; i++) {
    for (int m = 1; m <= maxCost; m++) {
      dp[i][m] = dp[i - 1][m], ps[i][m] = 0;
      int w = costs[i];
      ll v = points[i];

      if (w <= m and dp[i - 1][m - w] + v > dp[i][m]) {
        dp[i][m] = dp[i - 1][m - w] + v, ps[i][m] = 1;
      }
    }
  }
```

```cpp
  }

  vi is;
  for (int i = n, m = maxCost; i >= 1; --i) {
    if (ps[i][m]) {
      is.emplace_back(i);
      m -= costs[i];
    }
  }

  return {dp[n][maxCost], is};
}
```

2.2 Binary Knapsack (top down)

Given N items, each with its own value V_i and weight W_i and a maximum knapsack weight W, compute the maximum value of the items that we can carry, if we can either ignore or take a particular item. Assume that $1 \le n \le 1000$, $1 \le S \le 10000$.

Time and space: $O(N * W)$

the bottom up version is 5 times faster !

```cpp
const int MAXN(2000), MAXM(2000);
ll memo[MAXN][MAXM + 1];
char choosen[MAXN][MAXM + 1];
ll knapSack(int u, int w, vll &VS, vi &WS) {
  if (u < 0) return 0;
  if (memo[u][w] != -1) return memo[u][w];

  ll a = 0, b = 0;
  a = knapSack(u - 1, w, VS, WS);
  if (WS[u] <= w)
    b = knapSack(u - 1, w - WS[u], VS, WS) + VS[u];
  if (b > a) {
    choosen[u][w] = true;
  }
  return memo[u][w] = max(a, b);
}
pair<ll, vi> knapSack(int W, vll &VS, vi &WS) {
  memset(memo, -1, sizeof(memo));
  memset(choosen, 0, sizeof(choosen));
  int n = len(VS);
  ll v = knapSack(n - 1, W, VS, WS);
  ll cw = W;
  vi choosed;
  for (int i = n - 1; i >= 0; i--) {
    if (choosen[i][cw]) {
      cw -= WS[i];
```

```cpp
      choosed.emplace_back(i);
    }
  }
  return {v, choosed};
}
```

2.3 Edit Distance

$O(N * M)$

```cpp
int edit_distance(const string &a, const string &b) {
  int n = a.size();
  int m = b.size();
  vector<vi> dp(n + 1, vi(m + 1, 0));

  int ADD = 1, DEL = 1, CHG = 1;
  for (int i = 0; i <= n; ++i) {

  }

  for (int i = 1; i <= n; ++i) {

                (a[i - 1] == b[j - 1] ? 0 : 1) * CHG;
      dp[i][j] = min({add, del, chg});
    }
  }

  return dp[n][m];
}
```

2.4 Kadane

Find the maximum subarray sum in a given a rray.

```cpp
int kadane(const vi &as) {
  vi s(len(as));
  s[0] = as[0];

  for (int i = 1; i < len(as); ++i)
    s[i] = max(as[i], s[i - 1] + as[i]);
```

```cpp
  return *max_element(all(s));
}
```

2.5 Longest Increasing Subsequence (LIS)

Finds the lenght of the longest subsequence in

$$O(n \log n)$$

.

```cpp
int LIS(const vi& as) {
  const ll oo = 1e18;
  int n = len(as);
  vll lis(n + 1, oo);
  lis[0] = -oo;

  auto ans = 0;

    ans = max(ans, pos);
    lis[pos] = as[i];
  }

  return ans;
}
```

2.6 Money Sum (Bottom Up)

Find every possible sum using the given values only once.

```cpp
set<int> money_sum(const vi &xs) {
  using vc = vector<char>;
  using vvc = vector<vc>;
  int _m = accumulate(all(xs), 0);
  int _n = xs.size();

        _dp[i][j + xs[i]] = 1;
        _dp[i][j] = 1;
```

```cpp
        }
      }
    }

    for (int i = 0; i < _n; ++i)
      for (int j = 0; j <= _m; ++j)
        if (_dp[i][j]) _ans.insert(j);

7 Problems

7.1 Hanoi Tower

Let T_n be the total of moves to solve a hanoi tower, we know that $T_n >= 2 \cdot T_{n-1} + 1$, for $n > 0$, and $T_0 = 0$. By induction it's easy to see that $T_n = 2^n - 1$, for $n > 0$.

The following algorithm finds the necessary steps to solve the game for 3 stacks and n disks.

```cpp
void move(int a, int b) { cout << a << ' ' << b << endl; }
void solve(int n, int s, int e) {
  if (n == 0) return;
  if (n == 1) {
    move(s, e);
    return;
  }
  solve(n - 1, s, 6 - s - e);
  move(s, e);
  solve(n - 1, 6 - s - e, e);
}
```

8.1 Meet in the middle

Answers the query how many subsets of the vector xs have sum equal x.
Time: $O(N \cdot 2^{\frac{N}{2}})$
